## A tailored solution for your UAV missions – the cloud portion

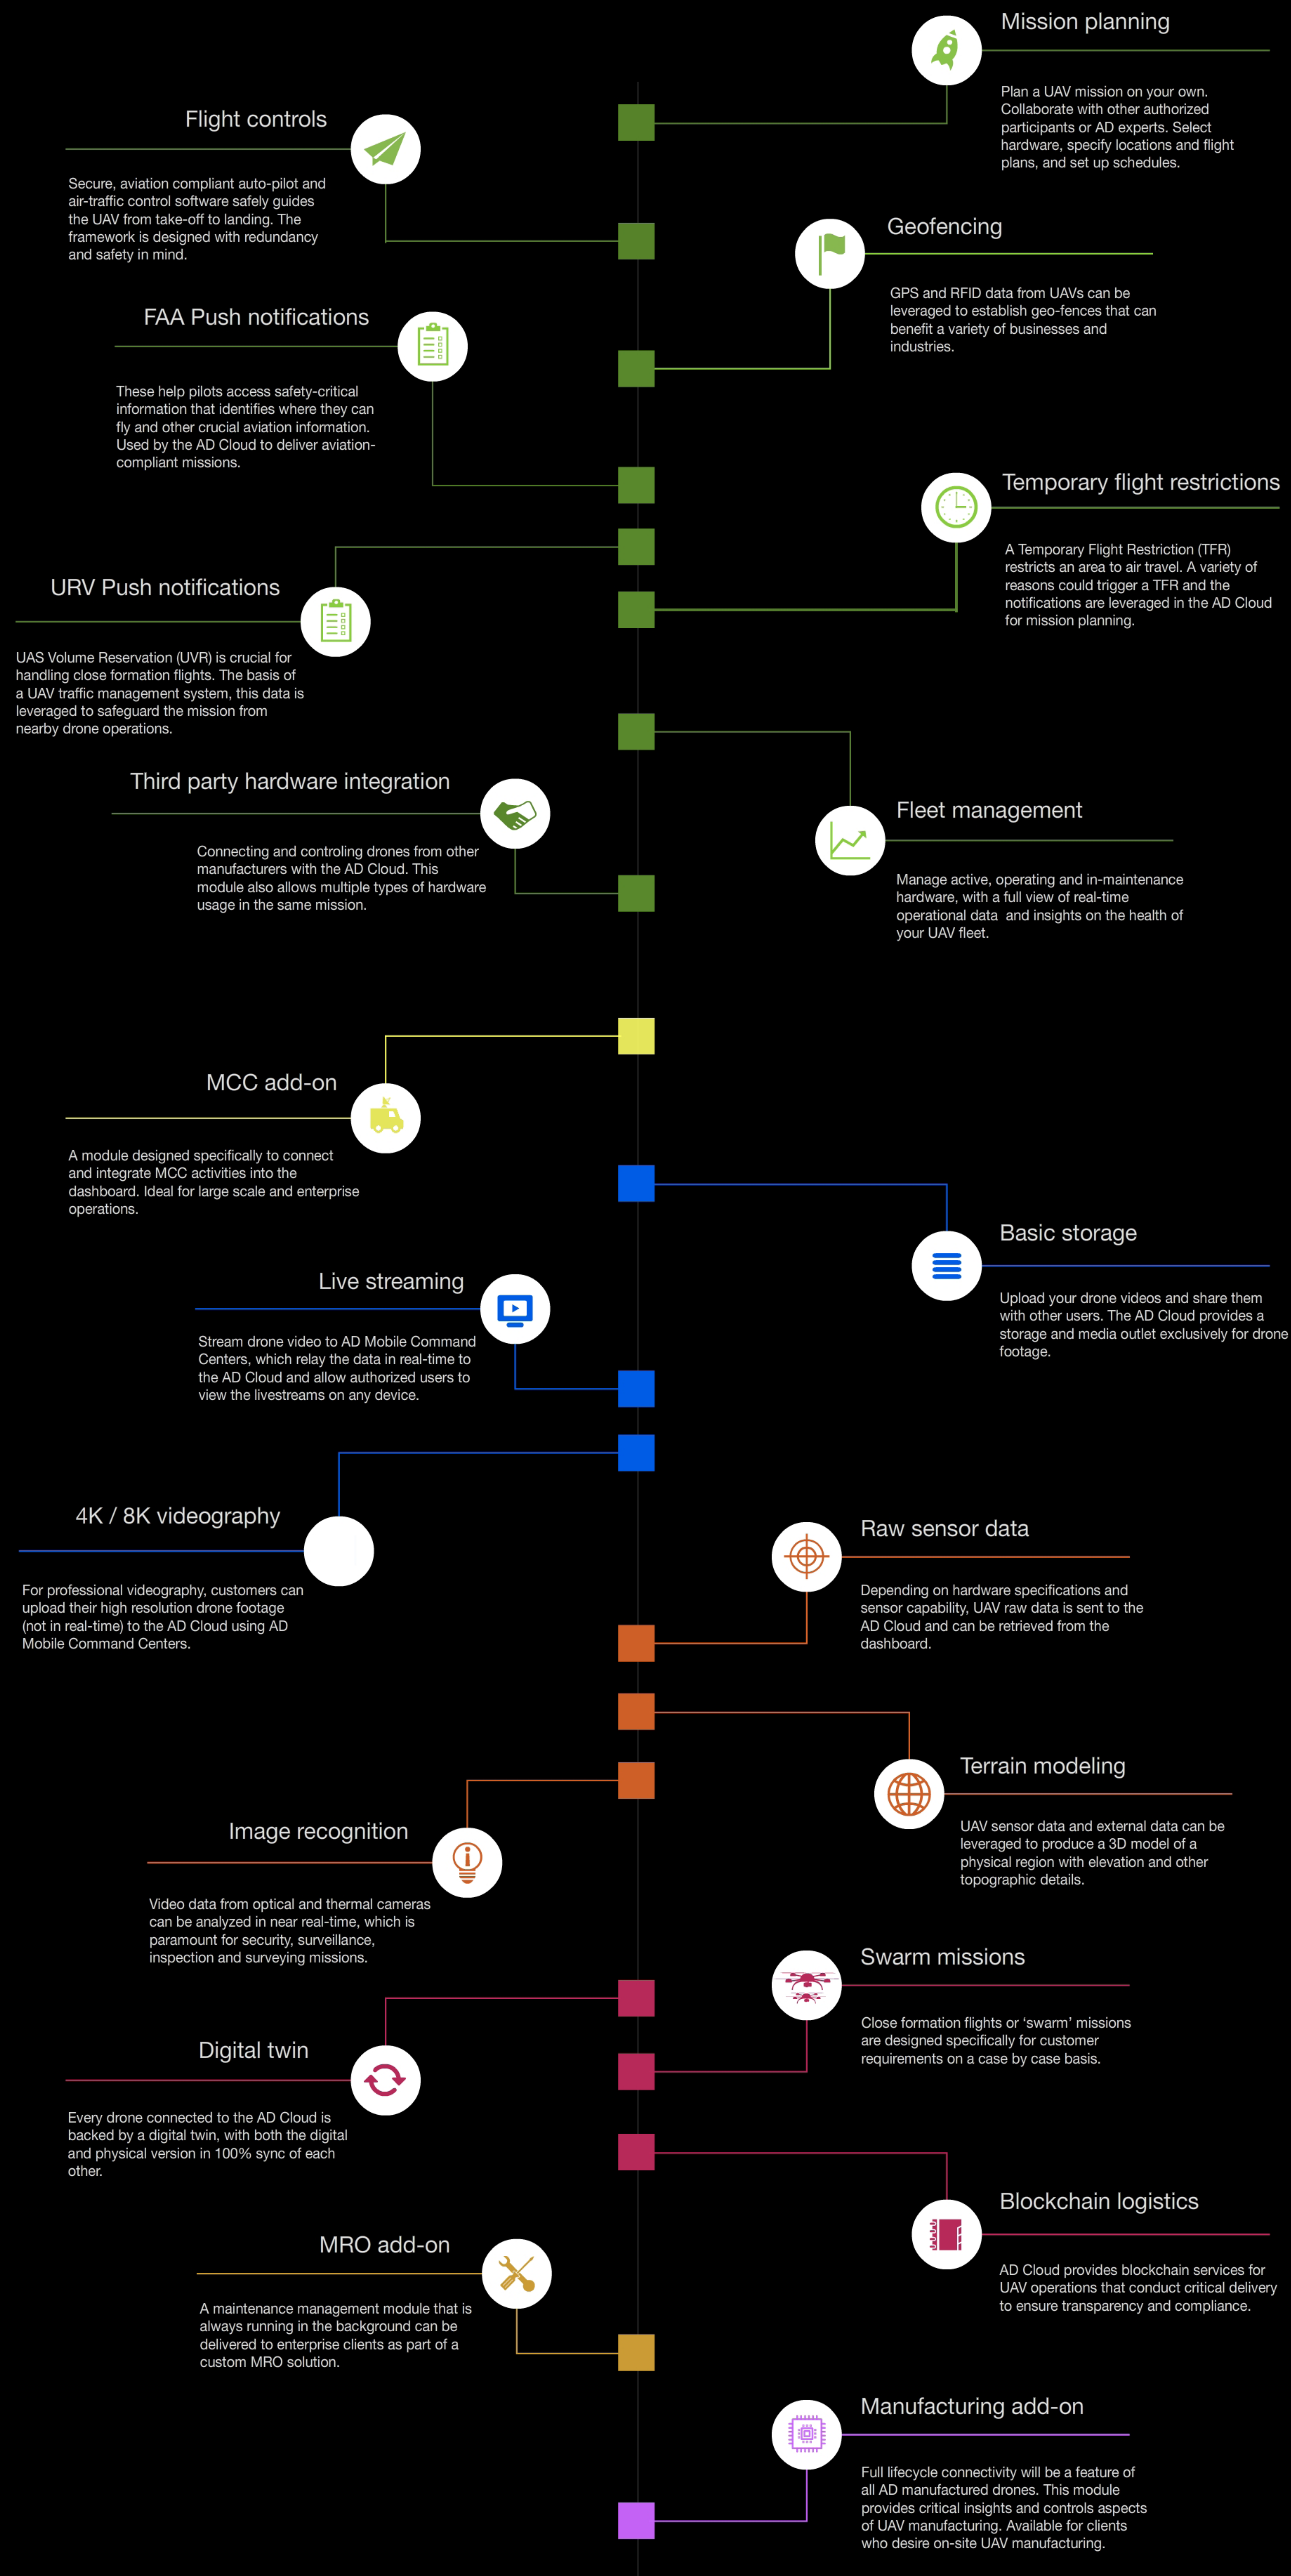

AD Cloud: A modular, full lifecycle approach to UAV solutions.

A complete end-to-end solution portfolio that can be tailored to ANY mission because of its modular architecture. Any UAV mission can be distilled into a specific combination of AD Cloud capabilities.

The modules contain core features as well as add-ons for specialized and large-scale missions. In addition, a cloud-driven, web-based dashboard ensures access and control from any device and location.

### Capability modules

### What's always included

The core AD solution contains all the critical capabilities from the Command and control module, along with basic video storage and raw UAV sensor data views. Suited for a handful of drones, this solution can easily be scaled up by adding more capabilities.

The MCC infrastructure required for the missions is provided by AD and included in the solution.

The third party hardware integration module can be added if the drones are not of AD origin.
